High Density Grazing and Mobile Kraaling System at Phapong Mokhotlong, Lesotho

High density grazing is a holistic range management tool that is used to improve rangeland health condition.
Erection of Mobile Kraaling at Phapong
Significance of high density grazing

- It increases nutrient content and hydrological function of the soil
- Improves soil and forage quality
- Reduce selective grazing
- Reduce weed problems
- Increased diversity of plants species
- More uniform manure or urine deposition/distribution
After one week
Challenges towards successful implementation of UHDG in Lesotho

- Cultural believes/values
- Market orientation
